

Migrating away from US tech services

Why am I doing this.

In my opinion, lately the USA administration under Donald Trump has been engaged in highly antidemocratic behaviour.

There seems to be no effective democratic way for the american people to constrain their administration. I feel the only way americans can make their opposition felt is by reducing their consumption such that the very rich and powerful people who benefit from that consumption will react by curbing the administration.

As an act of sympathy to those americans, I have decided to reduce my consumption of American big tech services.

To do this I need to switch, as much I can, any services I consume from US companies to alternative non-US providers.

GOAL: ZERO USA goods, services, privacy, security footprint

Migration Log

Below is a log of the the services I have replaced below. I intend it to grow it until I reach a zero footprint goal.

AWS S3 and cloudshare

My first migration is to move my web site content away from my current american service: AWS S3 Storage and AWS cloudshare content delivery.

I needed a non US service that conformed to my ownership and jurisdiction requirements that would be as easy as possible to transition to.

I settled on [Bunny.net](#) as my new service provider.
